

Automated Production Intelligence™

Monitoring Software for Growth-Minded Precision
Manufacturers with No Operator Input™ Required

Expect More From Your Machine Monitoring

No Operator Input™ was born out of the pain and frustration of everyday shop leaders who had the courage to invest in monitoring technology, but did not deserve to be punished by the shortcomings of prior-generation systems. We took the time to learn from manufacturers and use that input to build a software system with out-of-the-box workflows that align with how you already work.

Datanomix redefines what manufacturing leaders should expect from their monitoring systems and delivers capabilities with no work required on your part to find the answers you seek. We simply connect to your CNC machines, and our software unveils production insights in real time and long-term factory trends over time. You don't need to assemble, export, crunch, or customize data—you simply click and review!

"It's our duty to return valuable time, profit, and productivity to our customers. Manufacturing is a tough business, filled with tougher people who deserve to have data collection, reporting, and analysis simplified for them."

DATANOMIX FOUNDER & CTO
Greg McHale

Job-Specific Benchmarks & Real-Time Scores

Datanomix automatically establish a benchmark for what good production looks like. We analyze and visualize Takt parts, cycle times, utilization, and throughput for each job and compare the current performance to the benchmark using a simple scoring system that everyone understands.

Look Up for Production Performance

Datanomix TV Mode displays live production KPIs around your factory. Your team will “look up” to discuss performance challenges and your best people will naturally flow to the jobs that need them the most.

Start Your Morning with Answers

Our Coffee Cup Report provides a summary of yesterday's production and it's delivered to your inbox every morning at 6:00 am. Run a successful production meeting by addressing issues instead of chasing people, paper and parts.

Data-Driven Planning

Our After Action Report offers insights into performance at a per-job and per-machine level over any given time range, helping with decision-making around staffing, job costing, and capital expenditures.

No More Reason Codes

Our Automated Downtime Insights™ automatically categorizes the reasons for expected and unexpected downtime during live production, providing a clear target for which processes to improve and without any operator input.

Take the Guesswork Out of Quoting

Our Quote Calibration Report gives you instant access to proper job performance so you can reconcile actual costs against your estimates to find the best opportunities for margin and optimization.

Improve Continuously

Our Continuous Improvement Hub consolidates job performance KPIs for factory health into a single dashboard that allows you to quickly track and validate top improvements and opportunities in machine utilization, time to first active part, and cycle time achievement.

Onboarding, Alarms, Scheduling & So Much More!

Unlock productivity, streamline operations, and increase profits with Automated Production Intelligence™ from Datanomix! To learn more about us or request a demo, visit our website at www.datanomix.io.
